Pharmacy

Pharmacy on the move

What is your pharmacy operation going to look like next year? In five years? Twenty years ago, who would have thought that now you'd be planning for the digital delivery of medications and rearranging the pharmacy floor plan to accommodate robotic processes and cleanrooms to meet federal regulations. Quality programs are integrating lean initiatives—even in the pharmacy. Outpatient, retail, and decentralized pharmacies have achieved more

patient-centered delivery—and reflect larger industry shifts in healthcare. Changing work processes and the related facility implications continue to require new ways of thinking and planning.

We make it our business to understand yours

Herman Miller for Healthcare has been consulting and creating clinical and administrative applications in healing environments for nearly 40 years. Our staff of healthcare planners, designers, and clinical consultants will work with you and your pharmacy professionals to create environments that support the delivery of quality patient care and function flawlessly now and into the future.

Build lasting value

Modularity stretches your initial investment. New equipment, technologies, and procedures can be integrated with little effort ... or expense. For the most part, you will be able to use the same products in different configurations. Products that can move from the central pharmacy into administrative and retail or decentralized pharmacies throughout the hospital also improve your investment and lower your cost of ownership. Even as medication administration changes, sometimes dramatically, your modular pharmacy furnishings won't miss a beat.

Products that work as hard as you

Adjust for function

Panel-attached components adjust in one-inch increments, connect easily, and can be readjusted without disassembling panels. A variety of panel configurations and heights create a variety of layouts and meet a range of functional and aesthetic needs. Supplement existing panels as needed without starting over.

Provide comfort

A choice of ergonomically designed, innovative, and comfortable seating, including stools, is offered in finish and upholstery options to meet cleaning requirements and work process needs.

Manage and update technology and equipment

Flexible and integrated cable management allows you to make changes without tear-down or disruption and control the flow of cables and wires and keep them off surfaces and the floor. Multiple access points make adding and moving equipment easy. A wire chase rail attaches to panels for use in technology-intensive areas.

Address specific work processes

Heavy-duty process tables are height adjustable, mobile, and provide under-surface storage. Medication carts store and transport materials; drawers and bins are interchangeable with pharmacy storage components. Stainless steel tables and wire carts, in a variety of sizes, meet cleanroom regulations.

Organize and store for efficiency and accuracy

From above to below the work surface, storage options are plentiful. Work organizers attach to tiles, keeping surfaces clear and items close at hand. Our entire line of storage/transport carts can be configured to work exactly the way you need them to and move supplies as needed.

A hospital pharmacy doesn't shut down. It's a constant flurry of activity and requires products that work as hard as you. Our products and applications can improve the contribution of your pharmacy department and the productivity of your staff.

Herman Miller for Healthcare's modular pharmacy system is the efficient and effective solution to designing pharmacy applications that meet your initial needs and change along with your requirements.

Keep it clean

Our clinical products are designed for easy, thorough, and frequent cleaning. Durable thermoplastics resist chipping and scratching. Integral color keeps up appearances over time.

Design a pharmacy you want to work in

Surface materials, colors, and patterns can create a pleasant work environment. Wood-grain laminates and nature imagery warm the pharmacy; bright surfaces support detailed work; adjustable and ergonomically designed products fit the sizes and preferences of the staff.

Refresh, don't replace

Modular products can be refreshed to update aesthetics or functionality; individual components can be changed without replacing the entire pharmacy product.

Create meeting and break areas

Our breadth of line supports areas within or adjacent to your central pharmacy. Tables, seating, and casework for conference or break areas are examples.

Support administrative functions

Our administrative products will outfit your staff offices and order entry areas. A complete line of desks, seating, and storage with aesthetic compatibility to clinical products completes the pharmacy department.
